

FINGER-SCREEN™

Engineered Rod Decks for Specialty Material Separation

General Kinematics engineered Rod Decks are designed for separation of difficult material that is prone to sticking or blinding in traditional screening applications. The secret behind the rod decks ability to perform, lies in the flexibility of the individual rods within the deck section, while maintaining the designed screening tolerance.

The heavy-duty design of GK Rod Decks allows for abrasive, heavy, wet or otherwise difficult material to easily cascade through the sorting area.

The high-stroke capabilities of GK's FINGER-SCREEN™, combined with the flexibility of the engineered rod deck assemblies, creates a versatile and high performance screening solution to maximize sorting in your process applications.
